

SOFFORD, 1634.
A new Almanacke, for
the yeere of our Lord
God, 1634.

Being the second from the Bis-
sextile or Leape-yeere.

Containing in it an Ephemerides
or the true place of the Sunne
in Longitude, and of the
Moone. both in Longitude and
Latitude.

Calculated especially for the La-
titude and Meridian of the most
honourable City of London:
but may very well serve for most
parts of great Britaine.

By Arthur Sofford, Philomathist.
*s homini sublimē dedit, cœliq; videre
cessit, & erectos ad sidera tollere vul-*
tu.

LONDON,

Printed for the Company of
Stationers.

Vulgar Notes, 1634.

Julian or English account.		Lilian, Gregorian or Roman account.

		Astrono.	

Sofford, 1634.

Astronomicall Calculations for this present year, 1634.

The true precession of the Equinoctiall, or rather, the true distance of the first Starre of Aries from the Equinoctiall poynt (the sayd Star with the rest of the fixed Starres being moved according to the succession of the Signes, as all the Planets are) according to Tycho Brahe and Kepler, is 28, degrees, 5, minutes, 3, seconds.

The greatest obliquity of the Zodiacke according to Tycho Brahe, is 23, deg. 31, min. and 30, sec. But Kepler (making the Sunns greatest Parallaxe to be lesse by two third parts then the Ancients and Tycho supposed it) would have the obliquity lesse by one min, viz. 23, deg. 30, min. & 30, sec.

The Eccentricity of the Sun vsed by Kepler in his Rudolphine Tables is 3600, parts, the whole sine being 10000

		deg.	min.	sec.

The place of the Moones }
Node Ascendent, June, 1. } 30, 34, 19, V

Of the four Quarters of the year, and first of Winter.

The Winter quarter tooke its beginning vpon the 11. day of December, in the year of our Lord God 1633. at 11. of the clocke and 6. minutes before noone, at which time the Sunne entred into the Tropicall signe of Capricorne, making the shortest day and longest Night to all that dwell on the North side of the Equinoctiall line: the length of the day then with vs at London, being 7. houres, 34. min. and 12. seconds; and the length of the night, 16. hour, 25. m. & 48. sec.

The nature of this quarter is cold and moist, and therefore is fitly resembled to the first declining age, to Slegme, to Water, and to the West Wind. Of

A Prognostication.

Of the Spring.

The Spring according to Astronomicall Calculation, taketh its beginning, vpon the tenth day of March the quarters of an houre before high Noone; at which instant the Sunne entreteth into the Equinoctiall Signe Aries, making equall day and night throughout the whole World.

The nature of the quarter is hot and moist, and therefore resembled well to youth to blond, to the apple, and to the South Wind.

Of the Summer.

The Summer being the third quarter Astronomicall, taketh beginning vpon the 11. day of Iune, at 2. of the Clocke and 38. min. after noone: the Sun then entring into the other Tropicall signe Cancer, and making the longest day and shortest night, to all that are on the Northerne side, of the Equinoctiall line. The length of the day being then with vs at London 16. houres, 25. min. and 48. seconds; and the night 7. houres, 34. min. and 12. seconds.

The nature of this quarter is hot and dry, and therefore it is resembled to Infancy, to Choller, to fire, & to the East Wind.

Of the Autumne.

Autumne or Harvest-quarter begins this yeare, vpon the thirteenth day of September, at 6. of the clocke in the Morning, the Sunne then entring into the other Equinoctiall signe Libra, & making once againe the dayes and nights equall throughout the whole World.

The Nature of this quarter is cold and dry, and therefore not exactly resembled to old age, to melancholy, to the earth, and to the North Wind.

*Verq; novum stabat cinctum florente corona
Stabat nuda estus, & spicae fertu gerebat :
stabat & Autumnus calcatis sordidus arvis,
Et glacialis Hyems canos hirsuta capillos. Ovid.*

Eclipses. 1634.

There will be presented to the view of the Inhabitants of the earth this yeare foure Eclipses, two of the Sun, and two

Sofford, 1634.

two of the Moone, whereof one onely and that of the Moone will be visible in our Horizon.

1. The first Eclipse will be of the Moone, and this is that which we shall see. It will happen upon the fourth day of March, being Tuesday. The beginning thereof will be at seven of the clocke and 4. minutes at night; the middle at 8. and 35. minutes; and the end at 10. a clocke and 7. minutes. So that the whole continuance from the beginning to the end, will be 3. houres and 3. minutes. The quantity of this Eclipse will be 9. points, and 17. min. that is somewhat more then 2 quarters of the body of the Moone.

2. The second Eclipse will be of the Sun, happening upon the 19 day of March; which considered in generall for the whole Earth, where it shall be seene, will be limited for the time with us at London, in this manner following.

The beginning thereof will be at 11. a clocke and 52. min. at night, on the 18. day of March; The beginning of the totall darknesse at 1. a clocke and 8. min. in the morning of the 19. day. The middle of the Eclipse at two a clocke and 74. min. The end of totall darknesse at 3. and 7. min. and the end of the whole Eclipse in all places of the Earth, will be at 4. of the clocke and 22. min.

So that the whole continuance of this Eclipse for all parts of the Earth where the Sun shall be seene either totally or partly Eclipsed, will be 4. houres and an halfe.

The whole continuance of the totall Eclipse for all parts of the Earth, where the Sun shall be totally Eclipsed, shall be two houres.

		d. g. min.
Semidiameter	Solis.	15. 15.
	Lunæ.	16. 9.
	Disci Terræ,	61. 17;
	Penumbræ.	31. 54.
	Vmbræ Lunæ.	0. 54.
Arcus inter centra amplius.		50. 28.
Horarius Lunæ a sole amplius.		34. 53.

This

A Prognostication.

This Eclipse will be seene in those Countreys which lye East from vs, and on this side of the Equinoctiall Line, especially in the middle of Tartaria, and about the Caspian sea, and some part of Persia, &c. in some of which places it will be a totall Eclipse.

3. The third Eclipse will be of the Moone, vpon the 28. day of August, the beginning thereof will be at 8. of the clocke and 57. minutes in the morning, the middle at 10. of the clocke and 30. minutes: and the end at 12. and 3. minutes. The whole continuance from the beginning to the end will be 3. and 6. min. the points Eclipsed 11. and 14. minutes.

It will be serue by our Antipodes, about their midnight, and by those of Iapan and the further parts of the East Indies, in the Evening, and in the West Indies, Virginia, &c. in their morning.

The 4. Eclipse will be of the Sun, vpon the 12. day of September. For the generall consideration whereof, in respect of the whole earth where it shall be seene, it will be thus limited for the time with vs at London, viz.

The beginning thereof, will be at 6. of the clocke and 5. min. in the morning, the middle at 8. and 39. min. and the end at 11 and 13. min. so that the whole continuance from the beginning to the end for all the places where it shall be seene, will be six houres and eight minutes.

Although this Eclipse happen in our day time, yet neither we, nor any Inhabitants on this side of the Equinoctiall line, shall see any part thereof, because the Moones Latitude is South, causing an Eclipse on the South side of the Equinoctiall Line. For about the Cape de bone Sperance will be seene a partiall Eclipse of the Sun, but the chiefe Eclipse will be in Terra Australis Incognita.

A Declaration of the 4, 5. and 6. Columnes of the Almanacke.

I In the fourth, fift and sixt Columnes of mine Almanack you haue the Longitude of the Sun, The Longitude of the Moon, and The Latitude of the Moone (as may appeare by their Ceterall titles) all diligently calculated by me (for the vse of
Sea,

Sofford. 1634.

Seamen and others that may have use of them) out of the Rudolphine Tables, begun by Tycho de Brahe, the Phoenix of Astronomers, and perfected by that learned and judicious Mathematician, Iohannes Keplerus.

The manner of finding out any of these three, is all one with that, which is used in all Ephemerides. For here you have the motions for every day of the yeare at noone according to the equall time (which differs not much from the apparent) and by convenient parts proportioned they may be had for any other time of the day. The way I intend not to shew, as being superfluous to those that can make use of them: onely I will speake a word or two of the Moones Latitude, because it is not common. You shall know therefore that as the way of the Sun, viz. the Ecliptick line declineth from the Equinoctiall; crossing it in two points onely, diametrically opposed, which we called the Equinoctiall points; and departing farthest from it in two other points diametrically opposed. which are called Tropicks, the one on the North side, and the other on the South side of the Equinoctiall line: In the very same manner, the Orbits or way of the Moone declineth from the Eclipticke line, crossing it in two opposite points onely, called Nodes; and departing farthest from it in two other opposite points called Limits; the one on the North side, and the other on the South side of the Eclipticke Line. The Nodes are vulgarly called the Dragons head, and the Dragons tayle: and these resemble the Suns Equinoctiall points. For as the Sun hath no Declination, when he is on the Equinoctiall points, so the Moone hath no Latitude, when she is in these Nodes. The limits are like the Suns Tropicks; for as the Sun hath greatest declination when he is in the Tropicks, in the North Tropicke *S.* towards the North, and in the South Tropicke *S.* towards the South, so the Moon being in these limits, hath greatest Latitude; in the North limits toward the North, & in the South limits toward the South. So that halfe the Moones course, she is on the North side of the Eclipticke, viz. whiles she is moving fro the Dragons head, to the Drag. tayle, & in this halfe she is said to have North Lat. which is marked by the letter N in the 6. Columnne of myn Almanacke.

Thy

A Prognostication.

The other halfe of her course she is on the South side of the Eclipse line, viz. whiles she moueth from the Dragons Tayle to the Dragons Head againe, and then is she said to haue South Latitude: and this is marked with the letter S.

And as the Latitude is thus distinguished into North and South by the Poles, so is it distinguished also by the limits into Ascending and Descending Latitude. For as long as the Moone moueth from the South limits to the North limits, she Ascendeth in respect of vs that inhabite this Northerne part of the world, and therefore her Latitude in this halfe of her Orbit, is called Ascending, marked with the letter A. But in the other halfe of her Orbit, from the North limits to the South limits, she Descendeth; and therefore her Latitude is called Descending, and this is marked with the letter D.

And note that where the letter N. is placed, there the North Latitude begins, and holbeth of that kind vnto the letter S. at which the South Latitude begins, and so it continueth vnto the letter N. againe.

And so likewise, where the letter A. is placed, there the Latitude Ascending begins, which is eyther South Ascending or North Ascending; and so it continueth ascending, vntill the letter D. be set downe; for then the Latitude Descending begins, which is eyther North Descending or South Descending, and so it continueth vnto the letter A. againe.

Brieue Rules of Husbandry.

Sow, set seedes, plant and graft, the Moone in \varnothing . η . ψ .
or Aquarius, the wind not easterly.

Sheare sheepe in the increase of the Moone.

Fell Timber for building towards and in the last quart.

Fell fypth and Coppice for scwell, in the last quarter.

Culd and lib Cattel, the Moone in Aries Ssgitar. or Capr,

Killfat Swine for Bacon about full Moone.

Cut Vines in February or March.

Remoue Trees at the last quarter, betwene Hollantide and Twelfetide.
